

Self-Evaluation Form for Milestone 4

Indicate below each bullet which method takes care of each task:

0. the data representation for representing pebble exchanges, including its interpretation
1. the data representation for representing the purchases of cards, including its interpretation
2. the strategy functionality for answering question 1 from the milestone its signature and purpose statement
3. the strategy functionality for answering question 2 from the milestone its signature and purpose statement
4. the strategy functionality for determining which pebble exchanges a player wishes to conduct; its signature and purpose statement
5. the strategy functionality for tie-breaking card purchases
6. the strategy functionality for tie-breaking the exchanges of pebbles
7. unit tests that show
 - no cards can be bought with the available pebbles
 - a card can be bought without exchanges of pebbles
 - a card can be bought after an exchange of pebbles
 - two cards can be bought after an exchange of pebbles
8. Explain how your code abstracts over the two rather similar strategies.
 - If it uses the template-and-hook pattern from Fundamentals II, you may say so and explain where the abstract class and concrete classes are to be found.
 - If it uses the command pattern from Fundamentals III, you may say so and point to the the parameter is passed in, where it is used, and where the argument for the parameter is supplied.
 - If your code employs some other design pattern, explain.

The ideal feedback for each of these points is a GitHub perma-link to the range of lines in a specific file or a collection of files.

A lesser alternative is to specify paths to files and, if files are longer than a laptop screen, positions within files are appropriate responses.

You may wish to add a sentence that explains how you think the specified code snippets answer the request.

If you failed to do any of the above points, say so.
